CATECHOL DIETHERS AS SELECTIVE PDE<sub>IV</sub> INHIBITORSBackground of the Invention

This invention relates to a series of 4-substituted catechol diether compounds which are selective inhibitors of phosphodiesterase (PDE) type IV and as such are useful in the treatment of AIDS, asthma, arthritis, bronchitis, chronic obstructive airways disease, psoriasis, allergic rhinitis, dermatitis and other inflammatory diseases.

This invention also relates to the pharmaceutically acceptable salts of said compounds; to a method of using such compounds in the treatment of inflammatory conditions in mammals, especially humans; and to pharmaceutical compositions useful therefor.

The "inflammatory conditions" which can be treated according to this invention include, but are not limited to, chronic obstructive pulmonary disease, shock, atopic dermatitis, bronchitis, rheumatoid arthritis and osteoarthritis.

Since the recognition that cyclic AMP is an intracellular second messenger (E. W. Sutherland, and T. W. Rall, Pharmacol. Rev., 1960, 12, 265), inhibition of the phosphodiesterases have been a target for modulation and, accordingly, therapeutic intervention in a range of disease processes. More recently, distinct classes of PDE have been recognized (J. A. Beavo and D. H. Reifsnyder, TiPS, 1990, 11, 150), and their selective inhibition has led to improved drug therapy (C. D. Nicholson, R. A. Challiss and M. Shahid, TiPS, 1991, 12, 19). More particularly, it has been recognized that inhibition of PDE type IV can lead to inhibition of inflammatory mediator release (M. W. Verghese *et al.*, J. Mol. Cell Cardiol., 1989, 12 (Suppl. II), S 61) and airway smooth muscle relaxation (T. J. Torphy in Directions for New Anti-Asthma Drugs, eds S. R. O'Donnell and C. G. A. Persson, 1988, 37, Birkhauser-Verlag). Thus, compounds that inhibit PDE type IV, but which have poor activity against other PDE types, would inhibit the release of inflammatory mediators and relax airway smooth muscle without causing cardiovascular effects or antiplatelet effects.

Certain pyrimidone compounds have been disclosed to be useful as antidepressants by Saccomano *et al.*, in European Patent Application EPO 247 725 A2. The same pyrimidone compounds have been disclosed to be useful against asthma and certain skin disorders in International Patent Application No. PCT/US90/02162, filed April 20, 1990.

#### Detailed Description of the Invention

The compounds of the invention can be prepared by a number of different processes according to the invention.

(a) In one process certain compounds of the formula (IV) can be prepared by the Wittig synthesis, according to the following reaction scheme:

-14-

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $j$  are as defined above for formula (I).

In a typical procedure, approximately one equivalent of the phenylphosphonium bromide (III), dissolved or suspended in dry THF, is treated with about 1.1 equivalents of 2.5M  $n\text{-BuLi}$  in hexane. This mixture is allowed to stir at about  $-78^\circ\text{C}$  for about one hour. Then approximately one equivalent of the aldehyde (II), dissolved in anhydrous THF, is added to the formed ylide solution at about  $-78^\circ\text{C}$ . After about one hour of stirring at about  $-78^\circ\text{C}$ , the reaction mixture is allowed to warm to room temperature over about 18 hours. The reaction is worked-up by pouring it into water and extracting twice with a solvent such as ethyl acetate. The ethyl acetate is evaporated and the crude product is chromatographed on silica gel using 15% ether/hexanes as the eluant to yield the desired compound (IV). Both the cis and trans isomers of (IV) are isolated.

(b) In another process, a compound of the formula (IV), where  $j$  is 1 and the  $\text{R}^3$  is either a methyl or an ethyl ester, is saponified to yield the analogous acid. In a typical procedure one equivalent of an ester of the formula (IV) is dissolved in a protic solvent, such as methanol. The ester is then mixed with about 1.5 to 10 equivalents (typically 2 equivalents) of 1N NaOH and heated at reflux temperature for about 0.5 hours to 5 hours (typically 1.5 hours). The reaction mixture is poured into water and washed once with a solvent, such as ethyl acetate. The aqueous layer is acidified to about pH 4 typically with HCl (aq) and extracted 3 times with ethyl acetate. The pure

-15-

desired product can be obtained by standard methods known to those skilled in the art such as crystallization or column chromatography on silica gel.

(c) In yet another process, a compound of the formula (IV) having the double bond can be hydrogenated to yield the corresponding alkylene analog. In a typical procedure about one equivalent of the compound (IV) is mixed with about 0.2 g to 1 g of 10% Pd/C in a mixture of protic and ether solvents, such as methanol and tetrahydrofuran. The mixture is placed in a Parr apparatus and pressurized with about 10 to 55 psi H<sub>2</sub>, usually about 20 psi H<sub>2</sub>, and shaken at room temperature (although the temperature may be raised as required) for about 1 to 24 hours, typically about 2 hours. The reaction mixture is filtered through celite to remove the catalyst and purified by chromatography on silica gel.

(d) In an alternative process, certain compounds of formula (VII) can be prepared by the Williamson synthesis, according to the following general reaction scheme:

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and j are as defined above for formula (I).

In a typical procedure, about 1 to 2 equivalents, typically about 1.05 equivalents, of a 60% oil dispersion of NaH is added to a solution of the alcohol of formula (V) at room temperature. The alcohol of formula (V) is usually dissolved in dry dimethylformamide. The mixture is stirred for about 0.5 to 2 hours, typically about 1 hour, at room temperature, at which time the bromo compound of formula (VI) is added. The reaction mixture is stirred and heated to 100-125°C for about 24 hours to 72 hours. The

-16-

reaction is worked-up by pouring it into water and extracting twice with ethyl acetate followed by purification by chromatography on silica gel.

(e) In a further process, certain compounds of general formula (IX) can be prepared by a Mitsunobu type reaction, according to the following general reaction scheme:

wherein R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and j are as defined above for formula (I).

In a typical procedure, about 1 to 5 equivalents, typically 1.2 equivalents, of diisopropylazodicarboxylate (DIAD) or diethylazodicarboxylate (DEAD) is added to a mixture of about one equivalent of the alcohol (V), about one equivalent of the phenol (VIII) and about 1.1 equivalents of triphenylphosphine (TPP). All of the reactants are dissolved in a dry solvent, such as tetrahydrofuran. The reaction is stirred at room temperature for about 6 to 24 hours, typically 18 hours. The solvent is evaporated and the crude oil is purified by column chromatography on silica gel to yield the compound of formula (IX).

(f) In another process, certain compounds of the formula (XI) are prepared by the following general reaction scheme:

-17-

wherein  $R^1$ ,  $R^2$ ,  $R^3$  and  $g$  are as defined above for formula (I).

About 1 equivalent of a secondary amine base, such as pyrrolidine is added to a room temperature solution of about 1 equivalent of the appropriately substituted chromanone (X) and about 1 equivalent of the necessary aldehyde (II) in a protic solvent such as methanol. The mixture is stirred for about 6 to 24 hours, usually 18 hours. The mixture is filtered to give the desired product as a solid. The compound of formula (XI) is then purified by either crystallization or by column chromatography. The compound of formula (XII) is obtained by hydrogenating compound (XI) analogous to method (c) above.

(g) In a further process, the ketone moiety of the chromanone compound of formula (XII) described hereinabove in method (f) can be reduced to the corresponding alcohol with a reducing agent such as  $NaBH_4$ . Approximately 0.8 equivalents of sodium

-18-

borohydride is added to a solution of approximately 1 equivalent of the chromanone (XII) and about 1 equivalent of  $\text{CeCl}_3 \cdot 7 \text{H}_2\text{O}$  in methanol and tetrahydrofuran. The temperature of the solution is usually about  $-20^\circ\text{C}$  to  $-78^\circ\text{C}$ , preferably  $-50^\circ\text{C}$ . The reaction mixture is allowed to warm to room temperature over about 18 hours. The reaction is worked up by diluting with ethyl acetate and washing once each with  $\text{NH}_4\text{Cl}$  (aqueous),  $\text{H}_2\text{O}$  and brine. It is then dried over  $\text{Na}_2\text{SO}_4$  and concentrated. The crude product is purified by chromatography on silica gel.

(h) Certain compounds having the general formula

formula (I), may be synthesized according to the following scheme:

A solution of about one equivalent of (XIV) in dry DMF is added dropwise to a suspension of about 1.1 equivalents of NaH in dry DMF at about  $0^\circ\text{C}$ . The solution is stirred at about  $0^\circ\text{C}$  for about 30 minutes when a one equivalent solution of (II) in dry DMF is added. The mixture is allowed to come to room temperature over about 18 hours. The mixture is poured into water and acidified to pH 1. The resulting precipitate is filtered and dried. Further purification is done by chromatography on silica gel.

(i) In yet another process, an alcohol of formula (XIII) described in method (h), above, may be dehydrated to give the corresponding alkenyl analog. In a typical procedure, about 1.5 equivalents of oxalyl chloride is added to a solution of about 2

-19-

equivalents of dry DMSO in dry methylene chloride at about  $-50^{\circ}\text{C}$  to  $-78^{\circ}\text{C}$ , preferably at  $-65^{\circ}\text{C}$ . A solution of the alcohol of the formula (XIII) described in method (h), above, dissolved in dry methylene chloride, is added to the cold solution of DMSO. This mixture is allowed to warm with stirring to about  $-30^{\circ}\text{C}$  over about 1 hour. It is then cooled to about  $-78^{\circ}\text{C}$  and 2 to 10 equivalents of triethylamine is added. This mixture is stirred at room temperature for about 1 hour. The reaction is worked-up by standard methods known to those skilled in the art and purified either by column chromatography on silica gel or by crystallization.

(j) Certain compounds of the formula (XVI) may be synthesized according to the scheme shown below:

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $b$  are as defined above for formula (I).

In a typical procedure, a ketone of the formula (XV) is heated with glyoxylic acid monohydrate at about  $100^{\circ}\text{C}$  to  $150^{\circ}\text{C}$ , preferably about  $120^{\circ}\text{C}$ . The reaction is cooled to about  $60^{\circ}\text{C}$  and about 2 ml of  $\text{H}_2\text{O}$  is added. About 20 to 30 drops of concentrated  $\text{NH}_4\text{OH}$  and about 1 equivalent of hydrazine monohydrate are added. The mixture is then heated at reflux for about 2 hours. It is cooled to room temperature and about 5 ml of water is added. The mixture is stirred for about 50 to 72 hours, preferably for about 60 hours. The suspension is filtered and purified by column chromatography on silica gel followed by crystallization.

-20-

wherein  $R^1$ ,  $R^2$ ,  $R^3$  and  $j$  are as defined above for formula (I).

A typical procedure is carried out by taking a solution of about one equivalent of the appropriate bromo compound (XVII), dissolved in dry THF, and cooling it to about  $-78^\circ\text{C}$ . About 1.1 equivalents of a 2.5M solution of  $n\text{-BuLi}$  is added to the bromo compound and stirred for about 40 minutes at about  $-78^\circ\text{C}$ . About 1.2 equivalents of a 1.0M solution of  $\text{ZnCl}_2$  in ether is added and the reaction mixture allowed to warm to room temperature over about 35 minutes. A catalytic amount, about 0.05 equivalents, of tetrakis(triphenylphosphine)palladium(0) and the required halo compound (XVIII), wherein "Halo" is I, Br or Cl but preferably I or Br, are added to the reaction mixture and allowed to stir for about 12 hours. The reaction is concentrated and chromatographed on silica gel to yield the desired compound of formula (XIX).

The mixture is cooled to room temperature, concentrated and chromatographed on silica gel to afford the desired tetrazole (XXI).

(m) Certain compounds of formula (I) may also be synthesized by reaction of bromo compounds (XVII) with amino compounds (XXII), according to the general reaction scheme:

The ability of the compounds or the pharmaceutically acceptable salts thereof to inhibit phosphodiesterase IV ( $\text{PDE}_4$ ) and, consequently, demonstrate their effectiveness for treating inflammatory diseases is shown by the following in vitro assay.

#### BIOLOGICAL ASSAY

(Human lung  $\text{PDE}_4$ )

Thirty to forty grams of human lung tissue is placed in 50 ml of pH 7.4 Tris/phenylmethylsulfonyl fluoride (PMSF)/sucrose buffer and homogenized using a Tekmar Tissumizer® (Tekmar Co., 7143 Kemper Road, Cincinnati, Ohio 45249) at full speed for 30 seconds. The homogenate is centrifuged at  $48,000 \times g$  for 70 minutes at  $4^\circ\text{C}$ . The supernatant is filtered twice through a  $0.22 \mu\text{m}$  filter and applied to a Mono-Q FPLC column (Pharmacia LKB Biotechnology, 800 Centennial Avenue, Piscataway, New Jersey 08854) pre-equilibrated with pH 7.4 Tris/PMSF buffer. A flow rate of 1 ml/minute is used to apply the sample to the column, followed by a 2 ml/minute flow rate for subsequent washing and elution. Sample is eluted using an increasing, step-wise NaCl gradient in the pH 7.4 Tris/PMSF buffer. Eight ml fractions are collected. Fractions are assayed for specific  $\text{PDE}_4$  activity, determined by  $[^3\text{H}]\text{cAMP}$  hydrolysis and the ability of a known  $\text{PDE}_4$  inhibitor (e.g. rolipram) to inhibit that hydrolysis. Appropriate fractions are pooled, diluted with ethylene glycol (2 ml ethylene glycol/5 ml of enzyme prep) and stored at  $-20^\circ\text{C}$  until use.

-27-

Compounds are dissolved in DMSO at a concentration of 10 mM and diluted 1:25 in water (400  $\mu$ M compound, 4% DMSO). Further serial dilutions are made in 4% DMSO to achieve desired concentrations. Final DMSO concentration in assay tube is 1%. In duplicate the following are added, in order, to a 12 x 75 mm glass tube (all concentrations are given as final concentrations in assay tube).

- i) 25  $\mu$ l compound or DMSO (1%, for control and blank)
- ii) 25  $\mu$ l pH 7.5 Tris buffer
- iii) [ $^3$ H]cAMP (1  $\mu$ M)
- iv) 25  $\mu$ l PDE<sub>IV</sub> enzyme (for blank, enzyme is preincubated in boiling water for 5 minutes)

The reaction tubes are shaken and placed in a water bath (37°C) for 20 minutes, at which time the reaction is stopped by placing the tubes in a boiling water bath for 4 minutes. Washing buffer (0.5 ml, 0.1M 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid (HEPES)/0.1M NaCl, pH 8.5) is added to each tube on an ice bath. The contents of each tube are applied to an Affi-Gel 601 column (Biorad Laboratories, P.O. Box 1229, 85A Marcus Drive, Melville, New York 11747) (boronate affinity gel, 1 ml bed volume) previously equilibrated with washing buffer. [ $^3$ H]cAMP is washed with 2 x 6 ml washing buffer, and [ $^3$ H]5'AMP is then eluted with 4 ml of 0.25M acetic acid. After vortexing, 1 ml of the elution is added to 3 ml scintillation fluid in a suitable vial, vortexed and counted for [ $^3$ H].

% Inhibition is determined by the formula:

$$\% \text{ Inhibition} = 1 - \frac{\text{average cpm (test compound)} - \text{average cpm (blank)}}{\text{average cpm (control)} - \text{average cpm (blank)}}$$

IC<sub>50</sub> is defined as that concentration of compound which inhibits 50% of specific hydrolysis of [ $^3$ H]cAMP to [ $^3$ H]5'AMP.

Pharmaceutically-acceptable acid addition salts of the compounds of this invention include, but are not limited to, those formed with HCl, HBr, HNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub>, H<sub>3</sub>PO<sub>4</sub>, CH<sub>3</sub>SO<sub>3</sub>H, p-CH<sub>3</sub>C<sub>6</sub>H<sub>4</sub>SO<sub>3</sub>H, CH<sub>3</sub>CO<sub>2</sub>H, gluconic acid, tartaric acid, maleic acid and succinic acid. In the case of those compounds of the formula (I) which contain a further basic nitrogen, it will, of course, be possible to form diacid addition salts (e.g., the dihydrochloride) as well as the usual monoacid addition salt. Pharmaceutically-acceptable cationic salts of the compounds of this invention include, but are not limited to, those of sodium, potassium, calcium, magnesium, ammonium, N,N'-dibenzylethylenediamine, N-methylglucamine (meglumine), ethanolamine and diethanolamine.

-28-

For administration to humans in the curative or prophylactic treatment of inflammatory conditions, oral dosages of the compounds are generally in the range of from 0.1-100 mg daily for an average adult patient (70 kg). Thus for a typical adult patient, individual tablets or capsules contain from 0.1 to 50 mg of active compound, in a suitable pharmaceutically acceptable vehicle or carrier. Dosages for intravenous administration are typically within the range of 0.1 to 10 mg per single dose as required. For intranasal or inhaler administration, the dosage is generally formulated as a 0.1 to 1% (w/v) solution. In practice the physician will determine the actual dosage which will be most suitable for an individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case but there can, of course, be individual instances where higher or lower dosage ranges are merited, and all such dosages are within the scope of this invention.

For human use, the compounds of the formula (I) can be administered alone, but will generally be administered in an admixture with a pharmaceutical diluent or carrier selected with regard to the intended route of administration and standard pharmaceutical practice. For example, they may be administered orally in the form of tablets containing such excipients as starch or lactose, or in capsules or ovals either alone or in admixture with excipients, or in the form of elixirs or suspensions containing flavoring or coloring agents. They may be injected parenterally; for example, intravenously, intramuscularly or subcutaneously. For parenteral administration, they are best used in the form of a sterile aqueous solution which may contain other substances; for example, enough salts or glucose to make the solution isotonic.

Thus in a further aspect the invention provides pharmaceutical compositions comprising a compound of the formula (I), or pharmaceutically acceptable salts thereof, together with a pharmaceutically acceptable diluent or carrier.

This invention also provides a method of inhibiting phosphodiesterase IV ( $PDE_{IV}$ ) in a mammal in need thereof which method comprises administering to said mammal a phosphodiesterase IV inhibiting amount of a compound of the formula (I) or pharmaceutically acceptable salt thereof.

This invention further provides a method of treating an inflammatory condition in mammals which comprises administering to said mammal an antiinflammatory amount of a compound of the formula (I) or pharmaceutically acceptable salt thereof.

Further still, this invention provides a method of treating AIDS, asthma, arthritis, bronchitis, chronic obstructive pulmonary disease, psoriasis, allergic rhinitis, dermatitis

-29-

or shock in a mammal which comprises administering to said mammal an effective amount of a compound or a pharmaceutically acceptable salt thereof.

The present invention is illustrated by the following examples, but it is not limited to the details thereof.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 93/ 10228

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 10-12 are directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
On grounds of Articles 6 and 17.2a(11) of the PCT (conciseness of claims) and of the Guidelines for Examination in the EPO, Part B, Chapter III, 2.2 (economic reasons) the search has been based on the preparation examples disclosed in the description.
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
